# LIYT Frontend User Interface Documentation

The LIYT platform features an intuitive user interface designed to streamline the delivery experience for both business owners and drivers. Upon visiting the platform, users are greeted by a landing page that introduces LIYT's services and benefits. This page allows users to explore and learn more about the platform before proceeding. By clicking the **Get Started** button,
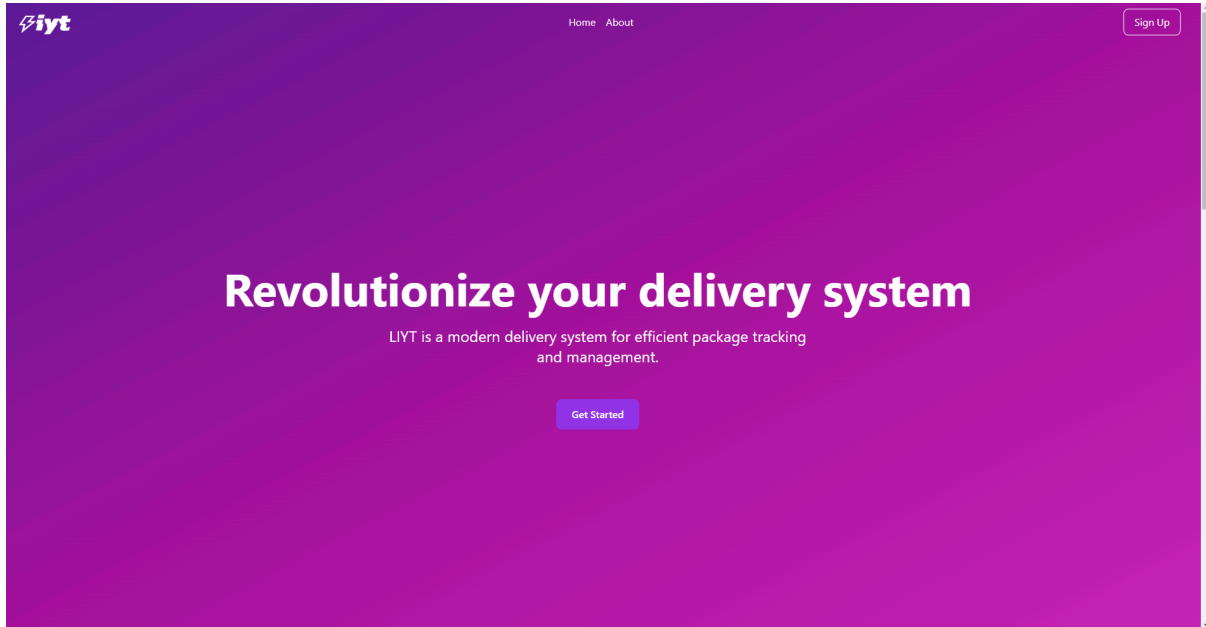

Users can begin the registration process and choose to sign up either as a business owner or a driver.
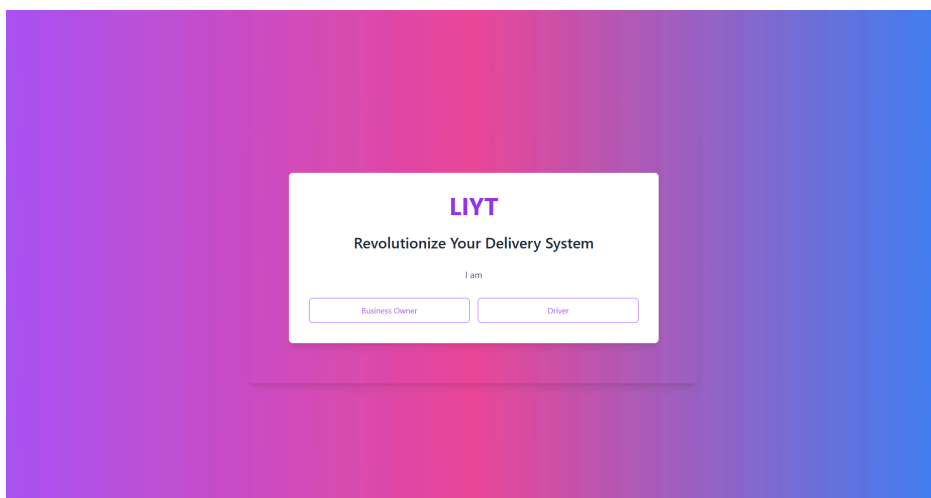

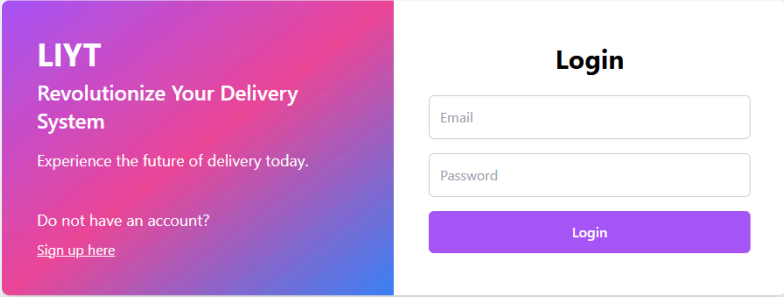

If a user selects the **Business Owner** option, they are directed to a sign-up page where they provide their personal information (first and last name, phone number, email, and password) and business details (business name, business email, primary address, and optional secondary address).

Once the form is submitted, they are redirected to the login page.

After logging in, business owners are returned to the landing page, where they can access the dashboard to create and track orders. They also gain access to the developer tools page, which allows them to integrate LIYT's API for automated order creation.

For drivers, the registration process involves entering personal information (first and last name, phone number, email, and password) and vehicle details (vehicle type and license plate number).

After submitting their registration form, drivers are redirected to the login page. Once logged in, they access a driver-specific page featuring a list of available jobs.
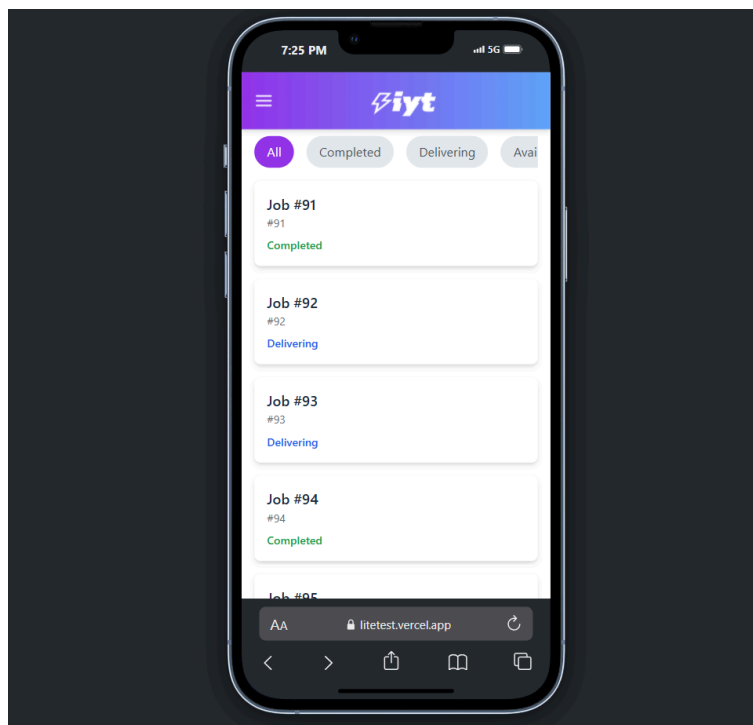

This list can be filtered by order status, including available, delivering, and completed jobs. Drivers can expand job details, accept jobs, and view a map with the pickup and drop-off locations. Upon completing a delivery, drivers can mark the job as complete directly within the interface.
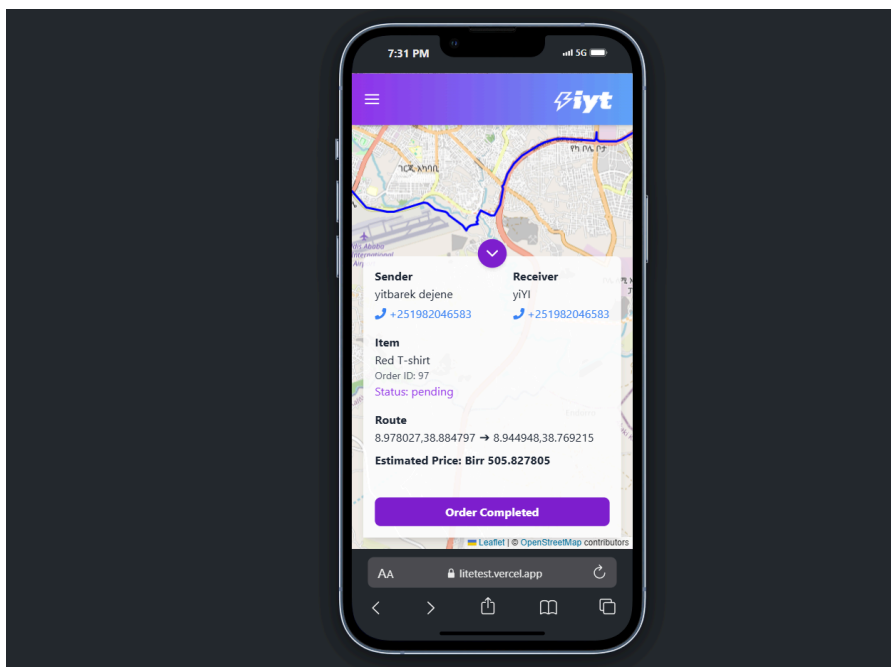

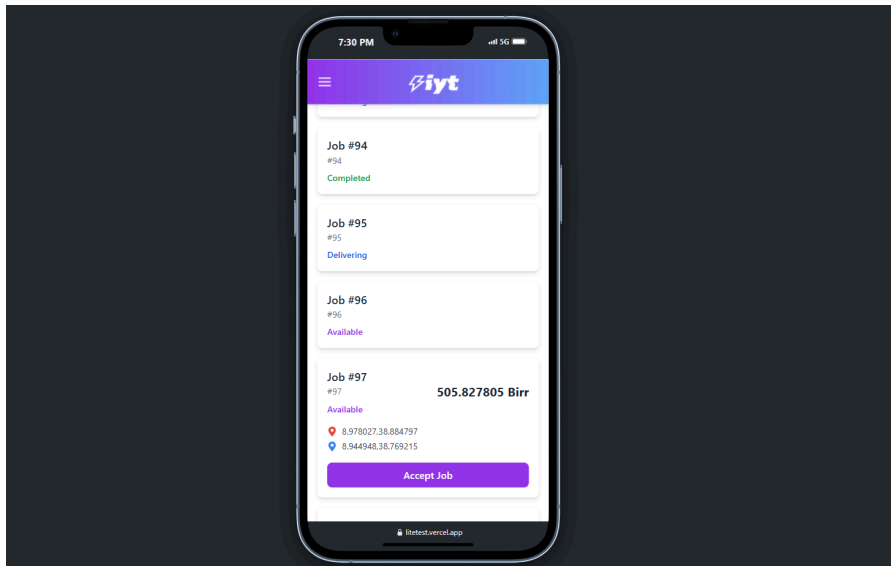

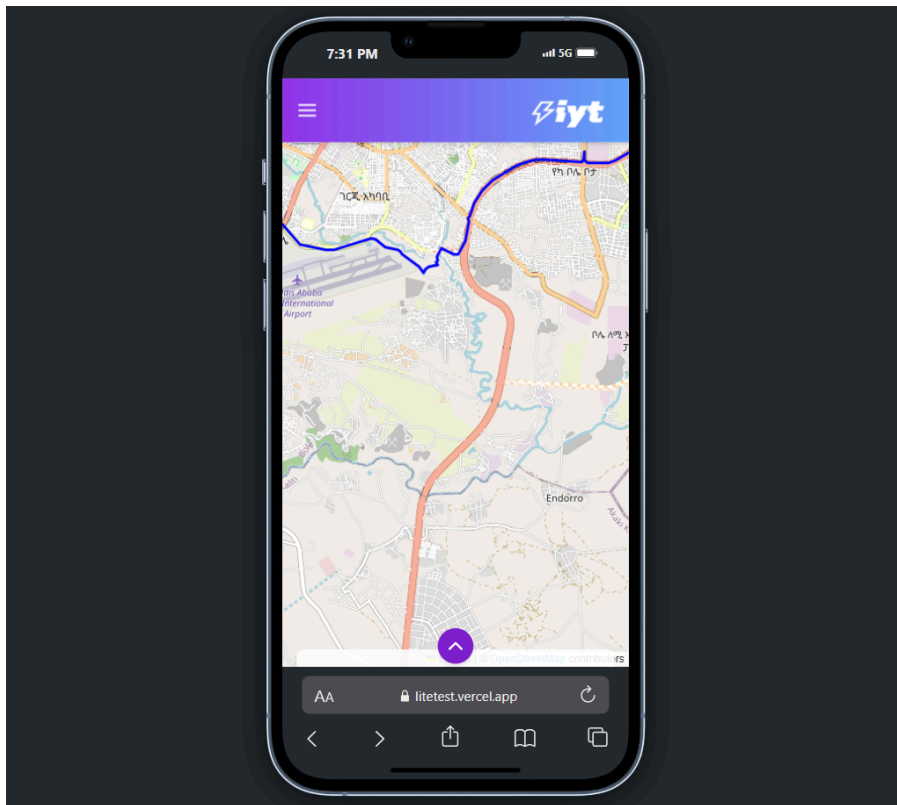

The LIYT platform is designed to provide a seamless experience for both business owners and drivers, ensuring easy navigation and efficient task management. Business owners can effortlessly manage and track their deliveries, while drivers are equipped with tools to efficiently accept, navigate, and complete their assigned tasks. This streamlined workflow ensures that LIYT meets the diverse needs of its users effectively.
